

Final EDA Summary

The exploratory data analysis found that the dataset is well-structured for delinquency prediction. It contains 500 records and 19 features, with missing values mainly in Income, Loan_Balance, and Credit_Score, and no duplicate records. Median imputation is recommended for missing numerical values.

The dataset is imbalanced (420 non-delinquent and 80 delinquent customers). Credit Utilization, Debt-to-Income Ratio, Credit Score, and Missed Payments are the main risk indicators. After handling missing values and class imbalance, the dataset is suitable for predictive modeling.
